An examination of adherence to contact tracing technology during COVID19 pandemic

COVID19 pandemic has created significant challenges for our society, with significant consequences on every aspect of our lives. In the absence of widespread access to treatment, contact tracing has been shown to be a promising and realistic response to control and contain spread of this virus. While some healthcare systems and hospital workers may have access to highly accurate location high-cost trackers are not available to the public general population. Alternatively, smartphone contact tracing applications were utilized in some countries; yet the adoption and use of these apps when non-mandated is low. Our goal is to
